Department of Software Engineering

Online Crockery Store Management System

Homely essentials by Maryam

PROJECT OVERVIEW

The rapid growth of online shopping has increased the demand for well-structured database systems to manage products, customers, and orders efficiently.

Homely Essentials is an online crockery store website developed using a modern web approach.

The database acts as the backbone of the system and is responsible for storing, organizing, and managing all data used by the website.

The database is designed to:

- Store product details
- Manage customer information
- Handle orders placed from the website
- Maintain proper relationships between data

PROBLEM STATEMENT

Traditional manual record-keeping for crockery stores is inefficient and prone to errors. Managing customers, products, orders, and inventory manually can lead to data inconsistency and poor customer experience.

The problem is to design a structured and normalized database system **that can efficiently manage** all data related to an online crockery store in a centralized manner.

TECHNOLOGIES USED

- **Database:** MySQL
- **Tool:** MySQL Workbench

WHY DATABASE IS NEEDED?

The database is required to:

- Store all products dynamically
- Manage customer orders
- Ensure data consistency and security
- Support future scalability
- To make the database easy to understand, implement, and explain

SCOPE OF THE SYSTEM

The scope of the **Homely Essentials database** includes:

- User management (customers and admin)
- Product and category management
- Shopping cart functionality
- Order and order item management
- Customer reviews and ratings
- Customer inquiries

The system does not include online payment or delivery tracking but can be extended easily in the future.

EXPLANATION

Shows complete order details using JOIN operations.

Security & Data Integrity

- Primary Keys ensure unique records
- Foreign Keys maintain relationships
- Normalized structure reduces redundancy
- Backend API protects direct database access

Project Strengths

- Well-structured relational database
- Proper use of primary and foreign keys
- Real-world order handling
- Scalable and maintainable design

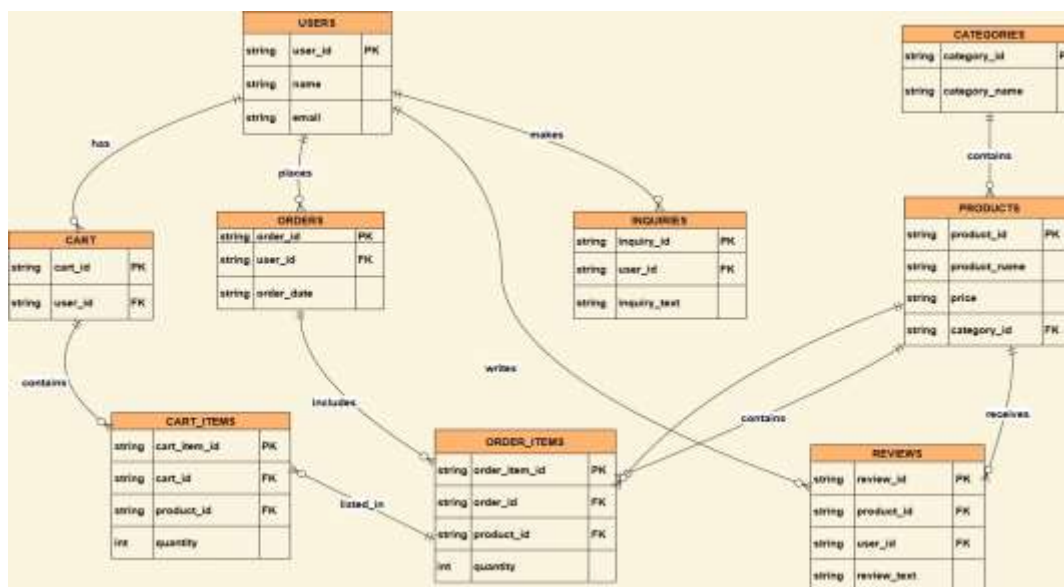

DATABASE DESIGN

The database design is based on real-world e-commerce requirements and follows normalization principle.

ENTITY RELATIONSHIP DIAGRAM

The **ER Diagram** represents entities such as Users, Products, Categories, Cart, Orders, Reviews, and Inquiries along with their relationships.

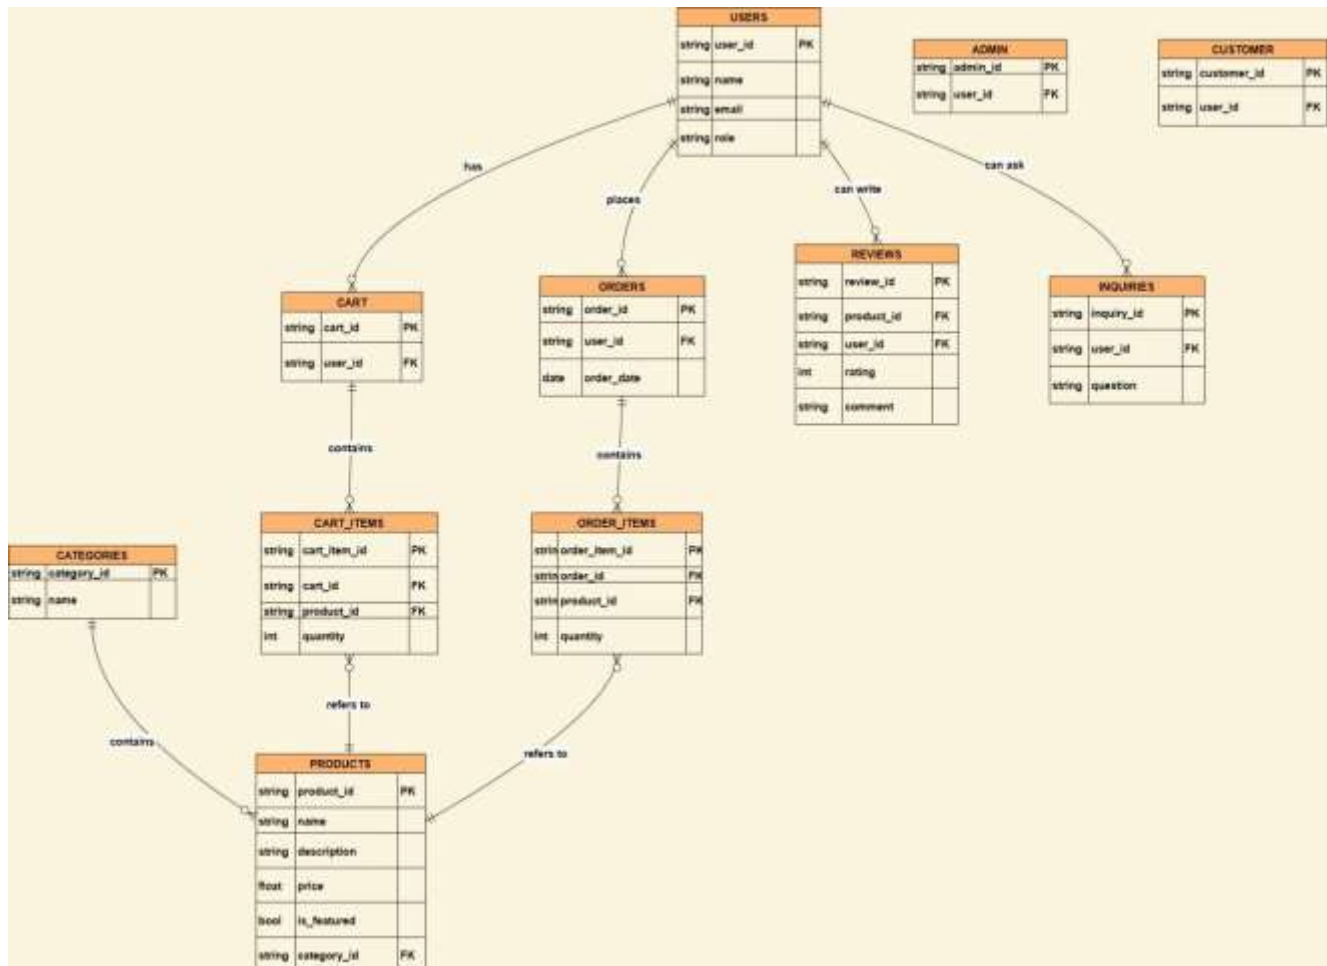

It shows how entities are connected and how data flows within the system

ENHANCED ENTITY RELATIONSHIP DIAGRAM

The **EER Diagram** extends the ER diagram by showing additional details such as user roles (admin and customer) and enhanced relationships.

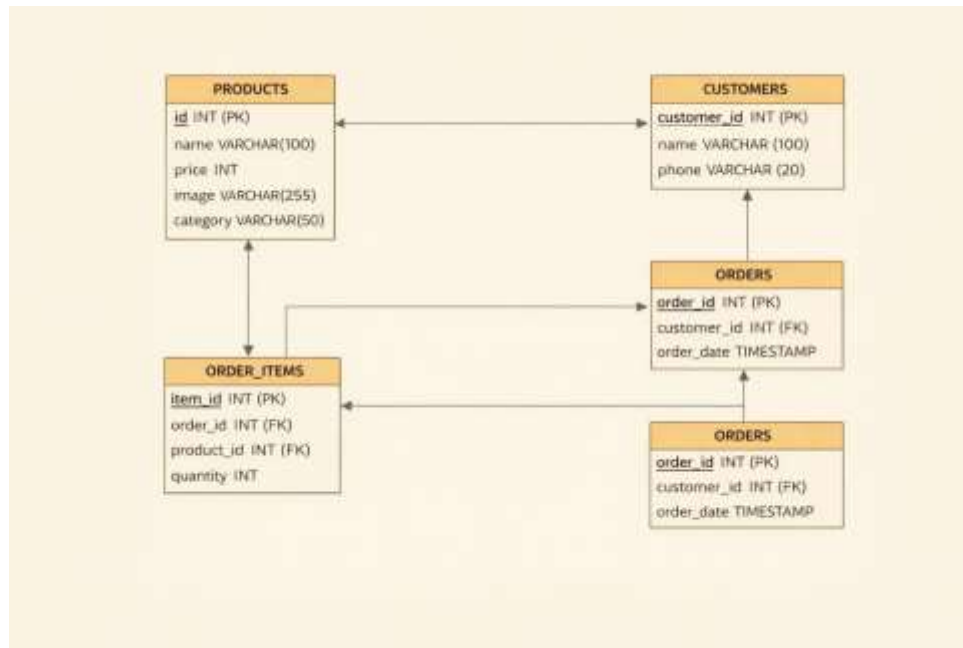

It provides a more detailed and realistic representation of the system.

SCHEMA DIAGRAM

The **Schema Diagram** shows the actual database structure, including tables, attributes, primary keys, and foreign keys.

It represents how the database is implemented in MySQL.

DATABASE TABLES DESCRIPTION

Users Table

Stores information about customers and admin users.

Primary Key: user_id

Categories Table

Stores product categories such as Dinner Sets and Kitchen Accessories.

Primary Key: category_id

Products Table

Stores product details including price, stock, and category.

Foreign Key: category_id

Cart Table

Represents a shopping cart for each user.

Foreign Key: user_id

Cart_Items Table

Stores products added to the cart with quantity.

Foreign Keys: cart_id, product_id

Orders Table

Stores customer order details and order status.

Order_Items Table

Stores individual items of each order.

Foreign Keys: order_id, product_id

Reviews Table

Stores customer ratings and reviews for products.

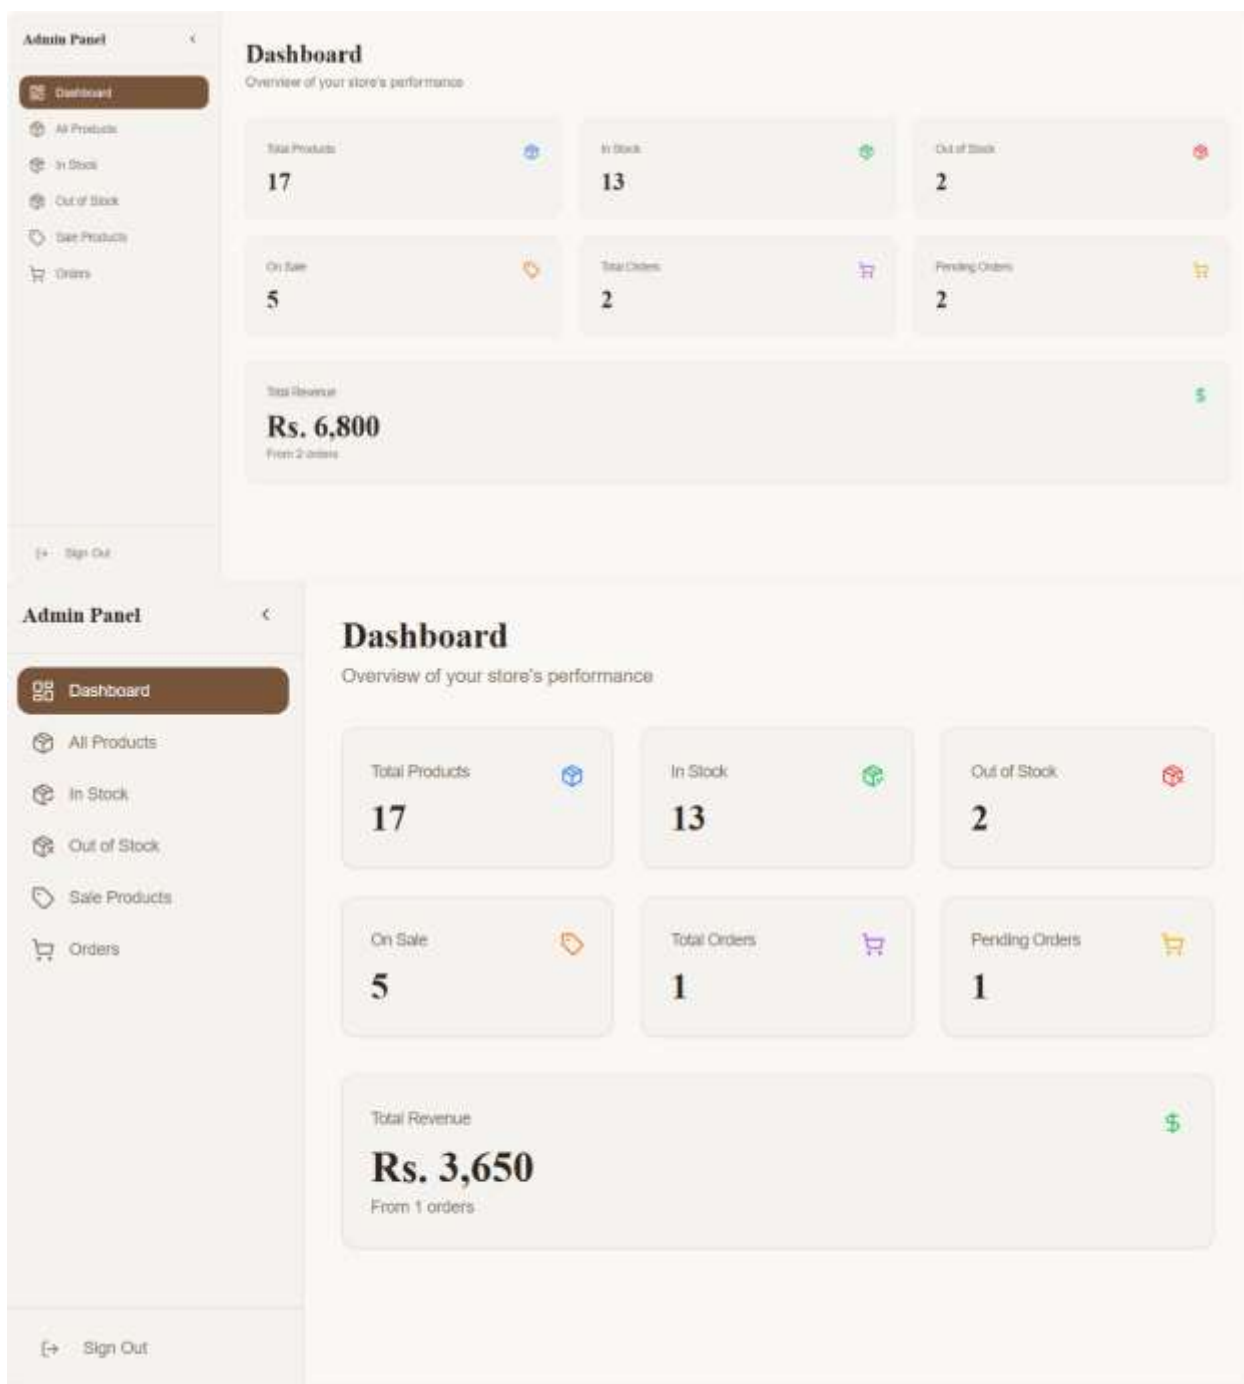

Foreign Key: product_id

Inquiries Table

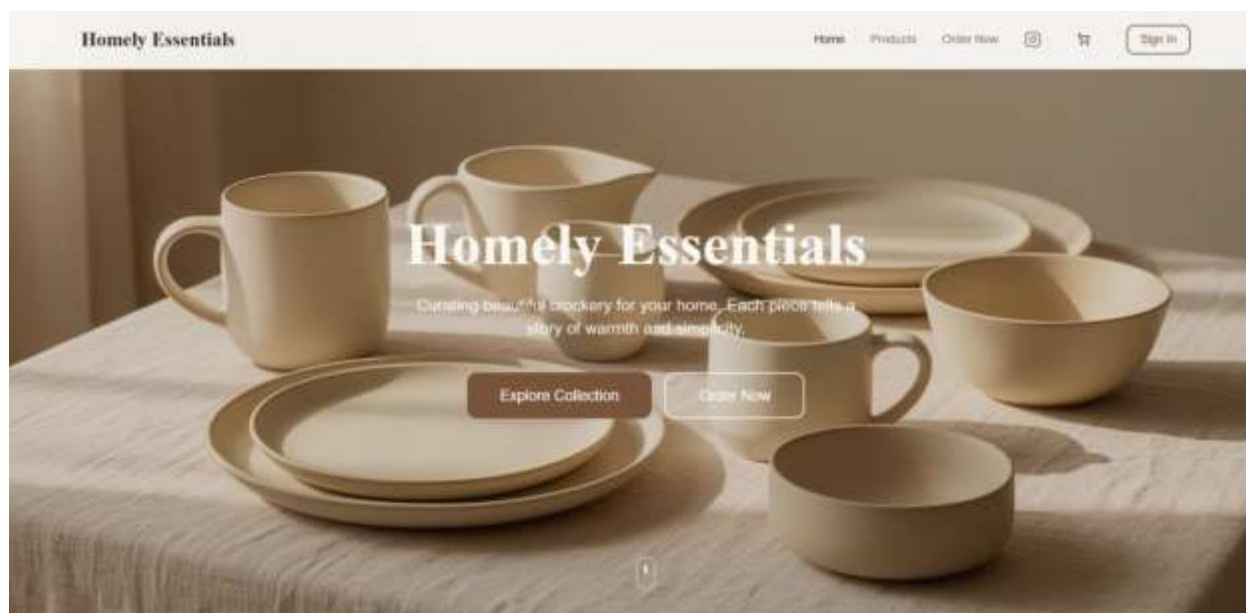

Stores customer inquiries and questions.

Order Process

- 1 Submit your order form
- 2 We confirm availability & pricing
- 3 Make payment via UPID/bank

THANK YOU, PAGE

Conclusion

The Homely Essentials database efficiently supports the website by managing products, customers, and orders.

It demonstrates practical use of MySQL concepts including:

- Joins
 - Filtering and sorting
 - Relationships
 - Table creation
-
